

注意事项

Jekyll can make HTML File automatically, but there are some mistakes about draw the table.
(I find it can beautify the Page by set CSS)

If I want to create a simple link I just need to link the folder's name. When I click the link, it will look for the index.html file priorly. If failed, then try to open [README.md](#).

Note: [README.md](#) often fails to render a formual. 🤖

If your page contains no formual, remember to use [README.md](#) as link engine. They are very easier to change. 🧐

If you still seek for normative and beautiful personal web, learn to use more powerful tool and css settings. 😊
